Video Projector

Reference Imaging CinePro 9x Elite

Every once in a while we come across a product that provides an unquestioned benchmark, and the Reference Imaging CinePro 9x Elite projector does just that. Its 9-inch CRTs produce images to die for. No words can do them justice—they simply must be experienced. The 9x Elite works great with any first-rate scaler, but to get the pictures *we* saw, you must use it with Teranex's HDX Cinema MX video processor and a full digital video source-to-processor-to-projector link. The cost of the Teranex is not included in the above price, which makes the combination—never mind the projector alone—a dream that might never come true for most of us. But technology has a way of coming through in the long run. In a few years, we wouldn't be surprised to see this sort of imaging filter come down to the price of, say, an entry-level luxury car (rather than a Rolls). It won't happen tomorrow, but it could happen if enough video engineers get to experience these products in action and see the target they should be aiming for.
